# ENDOMETRIOSIS

OGA EDUCATIONAL SERIES

# WELCOME

Welcome to Obstetrical and Gynecological Associates (OGA). Thank you for choosing us for your care. We are women, mothers, sisters and daughters, just like you, so we understand your concerns and relate to your needs. Our mission is to always expect the best outcome while providing caring, competent and compassionate care.

## ENDOMETRIOSIS

### What is endometriosis?

Endometriosis is a condition in which the type of tissue that forms the lining of the uterus (the endometrium) is found outside the uterus.

### How common is endometriosis?

Endometriosis occurs in about one in ten women of reproductive age. It is most often diagnosed in women in their 30s and 40s.

### Where does endometriosis occur?

Areas of endometrial tissue (often called implants) most often occur in the following places:

- Peritoneum.
- Ovaries.
- Fallopian tubes.
- Outer surfaces of the uterus, bladder, ureters, intestines, and rectum.
- Cul-de-sac (the space behind the uterus).
- If the endometriosis is inside the walls of the uterus it is called adenomyosis.

### How does endometriosis cause problems?

Endometriosis implants respond to changes in estrogen, a female hormone. The implants may grow and bleed like the uterine lining does during the menstrual cycle. Surrounding tissue can become irritated, inflamed, and swollen. The breakdown and bleeding of this tissue each month also can cause scar tissue, called adhesions, to form. Sometimes adhesions can cause organs to stick together. The bleeding, inflammation, and scarring can cause pain, especially before and during menstruation.

### **What is the link between infertility and endometriosis?**

Almost 40% of women with infertility have endometriosis. Inflammation from endometriosis may damage the sperm or egg or interfere with their movement through the fallopian tubes and uterus. In severe cases of endometriosis, the fallopian tubes may be blocked by adhesions or scar tissue.

### **What are the symptoms of endometriosis?**

The most common symptom of endometriosis is chronic (long-term) pelvic pain, especially just before and during the menstrual period. Pain also may occur during sex. If endometriosis is present on the bowel, pain during bowel movements can occur. If it affects the bladder, pain may be felt during urination. Heavy menstrual bleeding is another symptom of endometriosis. Many women with endometriosis have no symptoms.

### **How is endometriosis diagnosed?**

A health care provider first may do a physical exam, including a pelvic exam. However, the only way to tell for sure that you have endometriosis is through a surgical procedure called laparoscopy. Sometimes a small amount of tissue is removed during the procedure. This is called a biopsy.

### **How is endometriosis treated?**

Treatment for endometriosis depends on the extent of the disease, your symptoms, and whether you want to have children. Endometriosis may be treated with medication, surgery, or both. When pain is the primary problem, medication usually is tried first.

### **What medications are used to treat endometriosis?**

Medications that are used to treat endometriosis include pain relievers, such as non-steroidal anti-inflammatory drugs (NSAIDs), and hormonal medications, including birth control pills, progestin-only medications, and gonadotropin-releasing hormone agonists. Hormonal medications help slow the growth of the endometrial tissue and may keep new adhesions from forming. These drugs typically do not get rid of endometriosis tissue that is already there.

### **How can surgery treat endometriosis?**

Surgery can be done to relieve pain and improve fertility. During surgery, endometriosis implants can be removed. Sometimes after surgery, medication is still recommended to fully treat the symptoms.

**Does surgery cure endometriosis?**

After surgery, most women have relief from pain. However, about 40-80% of women have pain again within two years of surgery. The more severe the disease, the more likely it is to return. Taking birth control pills or other medications after having surgery may help extend the pain-free period.

**What if I still have severe pain that does not go away even after I have had treatment?**

If pain is severe and does not go away after treatment, a hysterectomy may be a "last resort" option. Endometriosis is less likely to come back if your ovaries also are removed. There is a small chance that pain will come back even if your uterus and ovaries are removed. This may be due to endometriosis that was not visible or could not be removed at the time of surgery or due to other medical conditions that cause pelvic pain.
